

# HECTOR

## for the tufting of cushions

The HECTOR presses the cushion together at the tufting point and sews a pattern, which provides an everlasting compression of the cushion and keeps the fabric and filling in place.

The HECTOR sews a pattern in the form of a circle or line, the size of which is fully adjustable from 4 to 25 mm (0,2 to 1 inch) by means of an allen screw. The number and length of the stitches to fit the pattern and the cushion are easily set with a dial. Changing into a new pattern takes less than a minute.

You can use HECTOR for cushions up to 12 cm (5 inches) thick, fabric or leather, containing polyether foam, crumb foam or fibre fill.

Normal working rate is 8 to 12 operations per minute.
